Homework Assignment: Contact Extraction for Your AI Agent

In this assignment, you will extend the digital twin agent you built during the workshop by adding a new capability: automatically detecting when a user introduces themselves and saving their contact information.

Task

Modify your agent so that when a user introduces themselves in a conversation (for example, "Hi, I'm a recruiter from Acme"), the agent can:

- Detect that the user is introducing themselves

- Extract relevant information

- Save this information as CSV using a tool

Requirements

Your implementation must:

- Detect when a user introduces themselves

- Extract at least the following fields:

  • Name

  • Company

  • Intent (e.g. hiring, collaboration, etc.)

- Use a tool such as save_contact(name, company, intent)

- Ensure the agent does NOT trigger on every message

- Only save contact information when reasonably confident

Examples

Examples that SHOULD trigger:

• "Hi, I'm John from Google, we're hiring AI engineers"

• "Hey, I'm a founder at a startup, would love to collaborate"

• “I’m a recruiter from Acme, can we talk?”

Examples that SHOULD NOT trigger:

• “I work at Google”

• “Google is a great company”

• “Tell me about Can”

Expected Output

You should demonstrate your implementation with at least two example conversations showing:

- The agent correctly detecting a contact introduction

- The tool being triggered

- The contact information being saved as CSV

Deliverables

Submit:

- Your Github repository

- At least two example interactions demonstrating the feature (put them as screenshots inside repository’s README.)
